Recording and Reporting System for Monitoring of Local Areas Immunization Program known as PWS is a procedure for recording and reporting a complete immunization program for the management of puskesmas, the problems encountered today, due to the untimely reporting of monthly activities and less integrated communication and administrative information caused by: the Center's software is heavy and prone to errors, HR program managers have not mastered the Microsoft Excel program, the workload of the Puskesmas is still too heavy.

The objective of the study was to analyze the program data management system, implementation (use) of monitoring the local area related to the technical management of the Immunization program data effectively and efficiently at the Cempae Health Center in particular and the Parepare City Health Office in general, in order to produce a program report by changing the application or new recording and reporting system. The research method used in this study is an action research approach, which describes and explains a social situation while making changes or interventions with the goal of improvement or participation. Data sources include document review, interviews, and observation with research informants who came from the person in charge of the immunization program at the puskesmas.

The result of the study revealed that the system-based health center immunization program recording and reporting system provided significant benefits for reporting by the program's in-charge, simplifying the calculation process and reducing the working time of program implementers at the puskesmas. To maximize the utilization of the system's implementation, puskesmas must provide some facilities that are currently lacking to support the system's implementation.
