The problem analysed in the study was about management. The objective of the study was to understand the management of fish farming at the marine and fisheries agency of Barru regency.

The study applied a descriptive-quantitative method to analyse data and information regarding management functions that affected fish farming. The data for the study were collected through interviews and observation. Indicators of the study were about the management functions from planning, organizing, actuating, and supervising. Population of the study were all employees of the marine and fisheries agency of Barru.

The results of the study showed that the planning function of the fish farming was categorised as poor and the fish farmers and the field workers (PPL) were not involved; the organizing function of the fish farming was categorised as poor and the PPL and the fish farmers were not played roles; the actuating function of the fish farming was categorised as poor and the fish farmers and the PPL of the agency were not involved; the supervising function of the fish farming was categorised as poor and the fish farmers were not involved even to just write the project reports.
