UPT PPRSA Inang Matutu *is a technical implementation unit that serves as a center for social rehabilitation services for children facing various social problems, such as violence, neglect, and conflict with the law. The diversity of problems faced by children, limited human resources, and the limited quota of service recipients have demanded a comprehensive intervention that a single party cannot solve. Therefore, a pentahelix collaboration approach is needed, which involves the synergy among the government, academics, business sector, community, and media to realize more effective, integrated, and sustainable social rehabilitation services for children. This study aims to analyze the form and dynamics of pentahelix collaboration in the rehabilitation services for children in* UPT PPRSA Inang Matutu.

This study applied a descriptive qualitative research method. The data were collected through in-depth interviews, observations, and documentation studies. The data were analyzed using an interactive approach through reduction, presentation, and conclusion drawing stages.

The result shows that pentahelix collaboration in UPT PPRSA Inang Matutu *has been implemented, though it is still in the transition stage from a bureaucratic pattern to a co-creative model. The government holds a dominant role as the regulator and facilitator, the academics serve in the knowledge-based research and training, the business sector gives support through the CSR program, the community acts as a field implementer and social facilitator, and the media works to spread information and shape public opinion. In general, the collaboration among the actors shows a positive direction toward inclusive and participatory social governance. However, it is still necessary to strengthen cross-sectoral coordination, improve the capacity of non-governmental actors, and establish sustainable partnership mechanisms.*
