Muttaqin

The hospital is one of the parts of the health service network that is very important. It is full of responsibilities, workload, problems, and hopes that patients hang onto it. Hospital management cannot be separated from human resources, which is an integral part of the entire part of hospital management and an important capital and property of all activities carried out in the hospital. One of the keys to the success of the service in the hospital is the employees. The Dadi Regional Specialized Hospital (RSKD Dadi) *is one of the recipient hospitals for COVID-19 patients. During the pandemic of COVID-19, it became a referral hospital, which resulted in an increase in nurses' workload, and in the end, will affect their performance.*

In this study, the author uses a quantitative method with a descriptive approach. The workload of the nurses is the main focus of this study by involving all of the nurses in each work unit. The research location is in The RSKD Dadi in South Sulawesi at Makassar city. The author obtained information that related to the research data through the questionnaire, whose validity and reliability had been tested using the Statistical Program for Special Science (SPSS).

The result of the research shows that the working condition of nurses is very heavy, the working time exceeds the regular hours, and the work target is too high.

Keywords: The Nurse Workload, The RSKD Dadi in South Sulawesi, COVID-19
