Lukman Samboteng

The pattern of Mutations of Police Members in the South Sulawesi Regional Police Forensic Laboratory is given in terms of mutation based on position assignment (TOD) and mutation based on assignment area (TOA). The objective of this study was to identify the Mutation Patterns of Polri Members in the South Sulawesi Regional Police Forensic Laboratory.

This study applied a qualitative research method with a descriptive approach. Because the research was only descriptive in nature, the author used the qualitative research method in this study. Specifically, the author wanted to describe, observe mutations based on position assignments and assignment areas for members of the Indonesian National Police in the South Sulawesi Regional Police Forensic Laboratory.

The result of the study showed that, with the implementation of the transfer of Polri members based on the TOA (Tour of Area) or TOD (Tour of Duty), each Polri member must accept a decision from the leadership, even if some Polri members are unhappy when transferred because the transfer is carried out in the form of refresh and adjustment in a new location. They are also excited because they will be able to improve their competence, and being close to family is one of the aspects that will help them perform better.

Keywords: TOA (Tour of Area), TOD (Tour of Duty), South Sulawesi Regional Police Forensic Laboratory
